ACCESSORIZE YOUR HOME HEATING-COOLING SYSTEM

There is a new development that allows a lot of homeowners to accessorize their central cooling and heating system. The work that needs to be done to accomplish this remarkable makeover usually requires zero remodeling or changing of existing appliances.

The reason for the development is that all basic furnace installations were never set up to get the hot air out of the second floor or stop the cold air from collecting in the basement.

Every multilevel homeowner wants to solve cooling the upstairs in the summer, conditioning the basement, and heating cold rooms in winter. These homeowners know the only manageable portion of the house is the main level around the thermostat.

They also immediately sense the difference as they go from level to level. Their frustration makes them think the system they have is too small or two systems would have zoned the levels better. All their efforts to cool the upstairs just run up the electric bill and freeze the basement. Heating is sometimes no better. There are rooms in these houses that are unlivable winter and summer.

Until now most accept and adjust to the way things are because the normal major overall is too expensive and inconvenient. It requires a complete home remodeling experience in most cases. That's what compelled Woody Bates at A&H Contractors Inc. to develop a simple low cost approach — Powerzoning.

Powerzoning stands alone in a sea of alternatives for zone control. It is a tremendous breakthrough from the traditional way of moving air around in the home. It is trademarked, copyrighted and patent pending. Powerzoning is the first reconfigurable way to have unparallel control have the existing heating and cooling system. It requires little or no remodeling, electricity, thermostats etc. It normally costs \$600 to \$900.

Powerzoning opens a cavernous route to force the supply and return merging of stratified air top and bottom for a more consistent temperature throughout. Powerzoning can match your living style and demands wherever you spend quality time in your home.

Powerzoning's refined design is engineered to team up with the furnace fan for a powerful boosting of the air flow. It makes the whole system work better and last longer.

Powerzoning testimonials range from top government officials to NFL players and coaches, to a grant funded study by Northern Illinois University. It works in townhomes and condos as well as single-family homes. It works in older homes where there are no returns on the second floor.

For instant answers to common questions, or for an in-depth understanding of Powerzoning features and operations or a thorough review of your system, homeowners can call **1-888-234-4525**, or visit our website: www.powerzoning.com
